

Combined Bearing Inspection Checklist

Blank inspection-scope worksheet for quotation, first-article review and batch release. This is a template, not a batch inspection certificate.

Inspection item	Characteristic	Suggested method	Acceptance basis	Result / report ID
Identification	Model, suffix, customer PO and batch/lot	Visual / document review	Marking and order specification agree	
Envelope dimensions	d, D, B/C, H, T, S and mounting interfaces	Caliper, micrometer, height/length instrument	Controlled drawing tolerance	
Running surfaces	Outer ring, axial roller and mating faces	Visual and optical inspection	No unapproved damage, corrosion or edge defects	
Adjustment	Eccentric range, screw adjustment or shim stack	Dial indicator / agreed fixture	Controlled drawing or approved sample	
Rotation	Smoothness, abnormal noise and interference	Manual / agreed rotation test	No binding or abnormal noise	
Material / hardness	Specified rings, stud and axial support	Certificate and hardness test when ordered	Purchase specification	
Lubrication / seals	Grease, seal execution and relubrication route	Visual / specification review	Approved order specification	
Packing	Rust protection, labels, quantity and export packing	Visual / count	Approved packing instruction	

Verification notes

- Record the instrument ID, calibration status, sample size, inspector, date and measured values in the order-specific report.
- State material, hardness, runout, load-test or first-article requirements before quotation.
- A completed batch report must identify the actual product, lot and controlled drawing revision.

Before ordering, confirm the current controlled drawing, suffix, mounting geometry, load case, lubrication, temperature and inspection scope.
